

EduTracker ERP: Client Deployment & One-Click Installation Manual

This manual provides the enterprise-level procedure for deploying the EduTracker system at a client's institution using our automated bundling and installation tools.

Phase 1: Preparing the Distribution (On Your Machine)

Before visiting the client, you must create a secure, production-ready package that contains no source code.

1. **Open PowerShell as Administrator.**
 2. **Navigate to Project Root:** `cd D:\cli\eduTracker.`
 3. **Run the Bundler:** `powershell powershell -ExecutionPolicy Bypass -File bundle_release.ps1`
 4. **Verify the Package:**
 - Locate the newly created folder: **EduTracker_Release.**
 - This folder contains the compiled application, operational scripts, and documentation.
 - **Intellectual Property Check:** Ensure there are NO `src` folders in this package.
-

Phase 2: Client Machine Prerequisites

Ensure the client's "Server PC" meets the following requirements:

1. **Operating System:** Windows 10/11 or Windows Server.
 2. **Node.js (LTS):** Download and install from nodejs.org.
 3. **PostgreSQL (v16+):**
 - Set the superuser password to: `123456`.
 - Create an empty database named: `edutracker`.
 4. **Network:** The PC must be connected to the school's local Wi-Fi or Ethernet network.
-

Phase 3: Installation Step-by-Step (At Client Office)

3.1 Transfer & Security

1. **Copy Folder:** Paste the `EduTracker_Release` folder from your USB to the client's D: or C: drive.
2. **Enable Scripts:**
 - **Open PowerShell as Administrator.**

- Run: `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Scope CurrentUser`

3.2 Automated Setup

1. **Run the Installer:**
 - Right-click **setup.ps1** inside the folder and select **Run with PowerShell**.
 2. **Automation Logic:**
 - The script will detect the school's Local IP address.
 - It will automatically configure all network settings and database connections.
 - It will create a **Desktop Shortcut** named “**EduTracker ERP**” for the user.
-

Phase 4: Launching the System

1. **Start the Engine:**
 - Double-click **START_SYSTEM.bat**.
 - *Operational Note: Instruct the client that this black window must remain open for the app to function.*
 2. **Access the ERP:**
 - Double-click the “**EduTracker ERP**” shortcut on the Windows Desktop.
-

Phase 5: Multi-User Access (Local Wi-Fi)

The system is designed for campus-wide use. 1. **Find the Network URL:** Look at the **START_SYSTEM.bat** window to see the IP (e.g., `http://192.168.0.102:6001`). 2. **Connect Other Devices:** Any staff member on the **same Wi-Fi** can type this URL into their browser. 3. **No Extra Install:** No software needs to be installed on other staff PCs; it works entirely through the browser.

Phase 6: Safety & Maintenance

1. **Backups:** Train the client to navigate to **Settings > Database & Backup** once a week and click **Backup Now**.
 2. **Updates:** To provide updates, simply replace the **backend/dist** and **.next** folders with new versions and restart the system.
